

Computerized Imaging Consent

In an attempt to determine if my expectations are realistic during my initial consultation with the physician, I will be imaged on the United/Vectra 3D Digital System Computer Imager. The system software is utilized to alter the features the physician will address with regard to the type of surgical procedure I may be interested in or he recommends during my consultation.

It is emphasized that the image the physician will create using the United/Vectra 3D Digital System Computer Imager is an ideal goal that the physician believes is achievable with the surgical procedure that will be proposed during my consultation. However, because of the unpredictability of healing and biology, the desired goal is in no way promised as an outcome of surgery.
